# Using the mhequ package 

Martin Hairer

Version 1.71, March 9, 2022

This package provides two environments: equ for single-line equations and equs for multi-line equations. They behave similarly to the built-in equation and amsmath's align environments and can essentially be used as drop-in replacements. The main difference is that equation numbers are handled differently: equations are numbered if and only if they have a \label, so there is no need for starred versions. This also applies to individual lines in a multiline equation. Also, the equs environment supports blocks of equation with more

Since mhequ redefines the \tag and \intertext commands, it should always be loaded after the amsmath package. However, these two commands should still behave correctly inside the amsmath environments. The rest of this document demonstrates the usage of the mhequ package, it is easiest to just read the source code of this document to see how it works. See also the description given at the start of the file mhequ.sty.

Here is a simple labelled equation:

$$
\begin{equation*}
e^{i \pi}+1=0 . \tag{1}
\end{equation*}
$$

Removing or adding the label does not require a change of environment:

$$
e^{i \pi}+1=0 .
$$

However, if the option numberall is set, then every single equation is numbered. A simple list of equations can be displayed either with one number per equation

$$
\begin{align*}
& f(x)=\sin (x)+1,  \tag{2}\\
& h(x)=f(x)+g(x)-3,  \tag{3}\\
& f(x)=\sin (x)+1,  \tag{4}\\
& h(x)=f(x)+g(x)-3, \tag{5}
\end{align*}
$$

or with one number for the whole list

$$
\begin{align*}
& f(x)=\sin (x)+1, \\
& h(x)=f(x)+g(x)-3 . \tag{6}
\end{align*}
$$

Of course, it can also have no number at all:

$$
\begin{aligned}
& f(x)=\sin (x)+1, \\
& h(x)=f(x)+g(x)-3 .
\end{aligned}
$$

The command \minilab\{label_name\} allows us to create a counter for the lines in a block of equations.

$$
\begin{equation*}
f(x)=\sin (x)+1 \tag{7a}
\end{equation*}
$$

$$
\begin{align*}
& g(x)=\cos (x)-x^{2}+4,  \tag{7b}\\
& h(x)=f(x)+g(x)-3 . \tag{7c}
\end{align*}
$$

One can refer to the whole block (7) or to one line, like (7a) for example. It is possible to use any tag one likes with the \tag\{displayed_tag\} command

$$
x=y,
$$

which in this case was used as $\backslash \operatorname{tag}\{\$ \backslash$ star $\$\}$. Such an equation can be referred to as usual: $(\star)$. Of course, mhequ can be used in conjunction with the usual equation environment, but mhequ is great, so why would you want to do this?

$$
\begin{equation*}
x=y+z \tag{8}
\end{equation*}
$$

Typesetting several columns of equations is quite easy and doesn't require 10 different environments with awkward names:

$$
\begin{array}{lll}
x=y+z & a=b+c & x=v \\
x=y+z & a=b+c & x=u+1 \\
& \text { (multicol) } \quad \begin{array}{l}
\text { (multicol) } \\
x=b
\end{array} \\
\begin{array}{ll}
a=y
\end{array} \\
x=y+z & a^{2}=(b-c)^{3}+y &
\end{array}
$$

and also (this is some \intertext)

$$
\begin{equation*}
x=y+z \quad a=(b+c)^{2}-5 \quad \ell=m \tag{10}
\end{equation*}
$$

We can even extend the block (7) much later using the \minilab\{label_name\} command:

$$
\begin{array}{clc}
x=y+z & x=y+z & f(x)=b \\
x=y+z & x=y+z & g(x)=b \\
\sin ^{2} x+\cos ^{2} x=1 \tag{7f}
\end{array}
$$

It is possible to change the type of subnumbering and to use the \text command without having to load amstext:

$$
\begin{array}{ll}
I_{1}=\int_{a}^{b} g(x) d x, & \text { (First equation) } \\
I_{2}=\int_{a}^{b} g\left(x^{2}-1\right) d x . & \text { (Second equation) } \tag{11B}
\end{array}
$$
