RFC 9249

A YANG Data Model for NTP

Abstract

This document defines a YANG data model for implementations of the Network Time Protocol (NTP) version 4. It can also be used to configure version 3. The data model includes configuration data and state data.

Status of This Memo

This is an Internet Standards Track document.

This document is a product of the Internet Engineering Task Force (IETF). It represents the consensus of the IETF community. It has received public review and has been approved for publication by the Internet Engineering Steering Group (IESG). Further information on Internet Standards is available in Section 2 of RFC 7841.

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at <https://www.rfc-editor.org/info/rfc9249>.

[Appendix A. Full YANG Tree](#)

[Acknowledgments](#)

[Authors' Addresses](#)

1. Introduction

This document defines a YANG data model [[RFC7950](#)] for implementations of the Network Time Protocol version 4 [[RFC5905](#)]. Note that the model could also be used to configure NTPv3 [[RFC1305](#)] (see [Section 7](#)).

The data model covers configuration of system parameters of NTP such as access rules, authentication and VPN Routing and Forwarding (VRF) binding, and various modes of NTP and per-interface parameters. It also provides access to information about running state of NTP implementations.

1.1. Operational State

NTP operational state is included in the same tree as NTP configuration, consistent with "[Network Management Datastore Architecture \(NMDA\)](#)" [[RFC8342](#)]. NTP current state and statistics are also maintained in the operational state. The operational state also includes the NTP association state.

1.2. Terminology

The terminology used in this document is aligned with [[RFC5905](#)] and [[RFC1305](#)].

1.3. Tree Diagrams

A simplified graphical representation of the data model is used in this document. This document uses the graphical representation of data models defined in [[RFC8340](#)].

1.4. Prefixes in Data Node Names

In this document, names of data nodes and other data model objects are often used without a prefix, as long as it is clear from the context in which YANG module each name is defined. Otherwise, names are prefixed using the standard prefix associated with the corresponding YANG module, as shown in [Table 1](#).

Prefix	YANG Module	Reference
yang	ietf-yang-types	[RFC6991]
inet	ietf-inet-types	[RFC6991]
if	ietf-interfaces	[RFC8343]
sys	ietf-system	[RFC7317]
acl	ietf-access-control-list	[RFC8519]
rt-types	ietf-routing-types	[RFC8294]
nacm	ietf-netconf-acm	[RFC8341]

Table 1: Prefixes and Corresponding YANG Modules

1.5. References in the Model

The following documents are referenced in the model defined in this document.

Title	Reference
Network Time Protocol Version 4: Protocol and Algorithms Specification	[RFC5905]
Common YANG Data Types	[RFC6991]
A YANG Data Model for System Management	[RFC7317]
Common YANG Data Types for the Routing Area	[RFC8294]
Network Configuration Access Control Model	[RFC8341]
A YANG Data Model for Interface Management	[RFC8343]
YANG Data Model for Network Access Control Lists (ACLs)	[RFC8519]
Message Authentication Code for the Network Time Protocol	[RFC8573]
The AES-CMAC Algorithm	[RFC4493]
The MD5 Message-Digest Algorithm	[RFC1321]
US Secure Hash Algorithm 1 (SHA1)	[RFC3174]
FIPS 180-4: Secure Hash Standard (SHS)	[SHS]

Table 2: References in the YANG Module

1.6. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

2. NTP Data Model

This document defines the YANG module "ietf-ntp", which has the following condensed structure:

```

module: ietf-ntp
  +--rw ntp!
    +--rw port?                               inet:port-number {ntp-port}?
    +--rw refclock-master!
      | +--rw master-stratum? ntp-stratum
    +--rw authentication {authentication}?
      | +--rw auth-enabled?          boolean
      | +--rw authentication-keys* [key-id]
      |   +--rw key-id              uint32
      |   +--...
    +--rw access-rules {access-rules}?
      | +--rw access-rule* [access-mode]
      |   +--rw access-mode        identityref
      |   +--rw acl?               -> /acl:acls/acl/name
    +--ro clock-state
      | +--ro system-status
      |   +--ro clock-state        identityref
      |   +--ro clock-stratum      ntp-stratum
      |   +--ro clock-refid        refid
      |   +--...
    +--rw unicast-configuration* [address type]
      |   {unicast-configuration}?
      |   +--rw address             inet:ip-address
      |   +--rw type               identityref
      |   +--...
    +--rw associations
      | +--ro association* [address local-mode isconfigured]
      |   +--ro address             inet:ip-address
      |   +--ro local-mode         identityref
      |   +--ro isconfigured       boolean
      |   +--...
      |   +--ro ntp-statistics
      |     +--...
    +--rw interfaces
      | +--rw interface* [name]
      |   +--rw name               if:interface-ref
      |   +--rw broadcast-server! {broadcast-server}?
      |     +--...
      |   +--rw broadcast-client! {broadcast-client}?
      |   +--rw multicast-server* [address] {multicast-server}?
      |     +--rw address
      |       | | rt-types:ip-multicast-group-address
  
```

```

|         | +--...
|         |--rw multicast-client* [address] {multicast-client}?
|         | +--rw address      rt-types:ip-multicast-group-address
|         |--rw manycast-server* [address] {manycast-server}?
|         | +--rw address      rt-types:ip-multicast-group-address
|         |--rw manycast-client* [address] {manycast-client}?
|         |   +--rw address
|         |     | rt-types:ip-multicast-group-address
|         |     +--...
|--ro ntp-statistics
+--...

rpcs:
+---x statistics-reset
+---w input
+---w (association-or-all)?
+--:(association)
| +---w associations-address?
| | -> /ntp/associations/association/address
| +---w associations-local-mode?
| | -> /ntp/associations/association/local-mode
| +---w associations-isconfigured?
| | -> /ntp/associations/association/isconfigured
+--:(all)

```

The full data model tree for the YANG module "ietf-ntp" is in [Appendix A](#).

This data model defines one top-level container that includes both the NTP configuration and the NTP running state including access rules, authentication, associations, unicast configurations, interfaces, system status, and associations.

3. Relationship with NTPv4-MIB

If the device implements the NTPv4-MIB [[RFC5907](#)], data nodes from the YANG module can be mapped to table entries in the NTPv4-MIB.

The following tables list the YANG data nodes with corresponding objects in the NTPv4-MIB.

YANG Data Nodes in /ntp/clock-state/system-status	NTPv4-MIB Objects
clock-state	ntpEntStatusCurrentMode
clock-stratum	ntpEntStatusStratum
clock-refid	ntpEntStatusActiveRefSourceId
	ntpEntStatusActiveRefSourceName
clock-precision	ntpEntTimePrecision

YANG Data Nodes in /ntp/clock-state/system-status	NTPv4-MIB Objects
clock-offset	ntpEntStatusActiveOffset
root-dispersion	ntpEntStatusDispersion

Table 3: YANG NTP Data Nodes in /ntp/clock-state/system-status and Related NTPv4-MIB Objects

YANG Data Nodes in /ntp/associations/	NTPv4-MIB Objects
address	ntpAssocAddressType
	ntpAssocAddress
stratum	ntpAssocStratum
refid	ntpAssocRefId
offset	ntpAssocOffset
delay	ntpAssocStatusDelay
dispersion	ntpAssocStatusDispersion
ntp-statistics/packet-sent	ntpAssocStatOutPkts
ntp-statistics/packet-received	ntpAssocStatInPkts
ntp-statistics/packet-dropped	ntpAssocStatProtocolError

Table 4: YANG NTP Data Nodes in /ntp/associations/ and Related NTPv4-MIB Objects

4. Relationship with RFC 7317

This section describes the relationship with definition of NTP in Section 3.2 (System Time Management) of [RFC7317]. YANG data nodes in /ntp/ also support per-interface configuration, which is not supported in /system/ntp. If the YANG data model defined in this document is implemented, then /system/ntp **SHOULD NOT** be used and **MUST** be ignored.

YANG Data Nodes in /ntp/	YANG Data Nodes in /system/ntp
ntp!	enabled
unicast-configuration	server
	server/name
unicast-configuration/address	server/transport/udp/address

YANG Data Nodes in /ntp/	YANG Data Nodes in /system/ntp
unicast-configuration/port	server/transport/udp/port
unicast-configuration/type	server/association-type
unicast-configuration/iburst	server/iburst
unicast-configuration/prefer	server/prefer

Table 5: YANG NTP Configuration Data Nodes and Counterparts from RFC 7317

5. Access Rules

The access rules in this section refers to the on-the-wire access control to the NTP service and completely independent of any management API access control, e.g., NETCONF Access Control Model (NACM) [RFC8341].

An Access Control List (ACL) is one of the basic elements used to configure device-forwarding behavior. An ACL is a user-ordered set of rules that is used to filter traffic on a networking device.

As per [RFC1305] (for NTPv3) and [RFC5905] (for NTPv4), NTP could include an access-control feature that prevents unauthorized access and that controls which peers are allowed to update the local clock. Further, it is useful to differentiate between the various kinds of access and attach a different acl-rule to each. For this, the YANG module allows such configuration via /ntp/access-rules. The access-rule itself is configured via [RFC8519].

The following access modes are supported:

Peer: Permit others to synchronize their time with the NTP entity or it can synchronize its time with others. NTP control queries are also accepted.

Server: Permit others to synchronize their time with the NTP entity, but vice versa is not supported. NTP control queries are accepted.

Server-only: Permit others to synchronize their time with the NTP entity, but vice versa is not supported. NTP control queries are not accepted.

Query-only: Only control queries are accepted.

Query-only is the most restricted whereas the peer is the full access authority. The ability to give different ACL rules for different access modes allows for a greater control by the operator.

6. Key Management

As per [RFC1305] (for NTPv3) and [RFC5905] (for NTPv4), when authentication is enabled, NTP employs a crypto-checksum, computed by the sender and checked by the receiver, together with a set of predistributed algorithms, and cryptographic keys indexed by a key identifier included in the NTP message. This key-id is a 32-bit unsigned integer that **MUST** be configured on the NTP peers before the authentication can be used. For this reason, this YANG module allows such configuration via `/ntp/authentication/authentication-keys/`. Further at the time of configuration of NTP association (for example, unicast-server), the key-id is specified.

The 'nacm:default-deny-all' is used to prevent retrieval of the actual key information after it is set.

7. NTP Version

This YANG data model allows a version to be configured for the NTP association, i.e., an operator can control the use of NTPv3 [RFC1305] or NTPv4 [RFC5905] for each association it forms. This allows backward compatibility with a legacy system. Note that NTPv3 [RFC1305] is obsoleted by NTPv4 [RFC5905].

8. NTP YANG Module

```
<CODE BEGINS> file "ietf-ntp@2022-06-10.yang"

module ietf-ntp {

/* Typedef Definitions */
```

```
typedef ntp-stratum {
  type uint8 {
    range "1..16";
  }
  description
    "The level of each server in the hierarchy is defined by
    a stratum. Primary servers are assigned with stratum
    one; secondary servers at each lower level are assigned with
    one stratum greater than the preceding level.";
  reference
    "RFC 5905: Network Time Protocol Version 4: Protocol and
    Algorithms Specification, Section 3";
}

typedef ntp-version {
  type uint8 {
    range "3..max";
  }
  default "4";
  description
    "The current NTP version supported by the corresponding
    association";
  reference
    "RFC 5905: Network Time Protocol Version 4: Protocol and
    Algorithms Specification, Section 1";
}

typedef refid {
  type union {
    type inet:ipv4-address;
    type uint32;
    type string {
      length "4";
    }
  }
  description
    "A code identifying the particular server or reference
    clock. The interpretation depends upon stratum. It
    could be an IPv4 address, the first 32 bits of the MD5 hash
    of the IPv6 address, or a string for the Reference Identifier
    and KISS codes. Some examples:

    -- a refclock ID like '127.127.1.0' for local clock sync

    -- uni/multi/broadcast associations for IPv4 will look like
    '203.0.113.1' and '0x4321FEDC' for IPv6

    -- sync with a primary source will look like 'DCN', 'NIST',
    'ATOM'

    -- KISS codes will look like 'AUTH', 'DROP', or 'RATE'

    Note that the use of an MD5 hash for IPv6 addresses is not
    for cryptographic purposes.";

  <packet-dropped>0</packet-dropped>
</ntp-statistics>
</unicast-configuration>
</ntp>
</data>
```

9.2. Refclock Master

This example describes how to configure reference clock with stratum 8:

```
<edit-config xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <target>
    <running/>
  </target>
  <config>
    <ntp xmlns="urn:ietf:params:xml:ns:yang:ietf-ntp">
      <refclock-master>
        <master-stratum>8</master-stratum>
      </refclock-master>
    </ntp>
  </config>
</edit-config>
```

This example describes how to get reference clock configuration:

```
<get>
  <filter type="subtree">
    <ntp xmlns="urn:ietf:params:xml:ns:yang:ietf-ntp">
      <refclock-master>
        </refclock-master>
      </ntp>
    </filter>
  </get>

<data xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <ntp xmlns="urn:ietf:params:xml:ns:yang:ietf-ntp">
    <refclock-master>
      <master-stratum>8</master-stratum>
    </refclock-master>
  </ntp>
</data>
```

9.3. Authentication Configuration

This example describes how to enable authentication and configure trusted authentication key 10 with mode as AES-CMAC and a hexadecimal string key:

```
<edit-config xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <target>
    <running/>
  </target>
  <config>
    <ntp xmlns="urn:ietf:params:xml:ns:yang:ietf-ntp">
      <authentication>
        <auth-enabled>true</auth-enabled>
        <authentication-keys>
          <key-id>10</key-id>
          <algorithm>aes-cmac</algorithm>
          <key>
            <hexadecimal-string>
              bb1d6929e95937287fa37d129b756746
            </hexadecimal-string>
          </key>
          <istrusted>true</istrusted>
        </authentication-keys>
      </authentication>
    </ntp>
  </config>
</edit-config>
```

9.4. Access Configuration

This example describes how to configure access mode "peer" associated with ACL 2000:

```
<edit-config xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <target>
    <running/>
  </target>
  <config>
    <ntp xmlns="urn:ietf:params:xml:ns:yang:ietf-ntp">
      <access-rules>
        <access-rule>
          <access-mode>peer-access-mode</access-mode>
          <acl>2000</acl>
        </access-rule>
      </access-rules>
    </ntp>
  </config>
</edit-config>
```

This example describes how to get access-related configuration:

```
<get>
  <filter type="subtree">
    <ntp xmlns="urn:ietf:params:xml:ns:yang:ietf-ntp">
      <access-rules>
      </access-rules>
    </ntp>
  </filter>
</get>

<data xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <ntp xmlns="urn:ietf:params:xml:ns:yang:ietf-ntp">
    <access-rules>
      <access-rule>
        <access-mode>peer-access-mode</access-mode>
        <acl>2000</acl>
      </access-rule>
    </access-rules>
  </ntp>
</data>
```

9.5. Multicast Configuration

This example describes how to configure a multicast-server with an address of "224.0.1.1", port of 1025, version of 3, and authentication keyid of 10.

```
<edit-config xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <target>
    <running/>
  </target>
  <config>
    <ntp xmlns="urn:ietf:params:xml:ns:yang:ietf-ntp">
      <interfaces>
        <interface>
          <name>Ethernet3/0/0</name>
          <multicast-server>
            <address>224.0.1.1</address>
            <authentication>
              <symmetric-key>
                <key-id>10</key-id>
              </symmetric-key>
            </authentication>
            <port>1025</port>
            <version>3</version>
          </multicast-server>
        </interface>
      </interfaces>
    </ntp>
  </config>
</edit-config>
```

This example describes how to get multicast-server-related configuration:

```
<get>
  <filter type="subtree">
    <ntp xmlns="urn:ietf:params:xml:ns:yang:ietf-ntp">
      <interfaces>
        <interface>
          <multicast-server>
          </multicast-server>
        </interface>
      </interfaces>
    </ntp>
  </filter>
</get>

<data xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <ntp xmlns="urn:ietf:params:xml:ns:yang:ietf-ntp">
    <interfaces>
      <interface>
        <name>Ethernet3/0/0</name>
        <multicast-server>
          <address>224.0.1.1</address>
          <ttl>8</ttl>
          <authentication>
            <symmetric-key>
              <key-id>10</key-id>
            </symmetric-key>
          </authentication>
          <minpoll>6</minpoll>
          <maxpoll>10</maxpoll>
          <port>1025</port>
          <version>3</version>
        </multicast-server>
      </interface>
    </interfaces>
  </ntp>
</data>
```

This example describes how to configure a multicast-client with an address of "224.0.1.1":

```
<edit-config xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <target>
    <running/>
  </target>
  <config>
    <ntp xmlns="urn:ietf:params:xml:ns:yang:ietf-ntp">
      <interfaces>
        <interface>
          <name>Ethernet3/0/0</name>
          <multicast-client>
            <address>224.0.1.1</address>
          </multicast-client>
        </interface>
      </interfaces>
    </ntp>
  </config>
</edit-config>
```

This example describes how to get multicast-client-related configuration:

```
<get>
  <filter type="subtree">
    <ntp xmlns="urn:ietf:params:xml:ns:yang:ietf-ntp">
      <interfaces>
        <interface>
          <multicast-client>
            </multicast-client>
          </interface>
        </interfaces>
      </ntp>
    </filter>
  </get>

<data xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <ntp xmlns="urn:ietf:params:xml:ns:yang:ietf-ntp">
    <interfaces>
      <interface>
        <name>Ethernet3/0/0</name>
        <multicast-client>
          <address>224.0.1.1</address>
        </multicast-client>
      </interface>
    </interfaces>
  </ntp>
</data>
```

9.6. Manycast Configuration

This example describes how to configure a manycast-client with an address of "224.0.1.1", port of 1025, and authentication keyid of 10:

```
<edit-config xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <target>
    <running/>
  </target>
  <config>
    <ntp xmlns="urn:ietf:params:xml:ns:yang:ietf-ntp">
      <interfaces>
        <interface>
          <name>Ethernet3/0/0</name>
          <multicast-client>
            <address>224.0.1.1</address>
            <authentication>
              <symmetric-key>
                <key-id>10</key-id>
              </symmetric-key>
            </authentication>
            <port>1025</port>
          </multicast-client>
        </interface>
      </interfaces>
    </ntp>
  </config>
</edit-config>
```

This example describes how to get multicast-client-related configuration:

```
<get>
  <filter type="subtree">
    <ntp xmlns="urn:ietf:params:xml:ns:yang:ietf-ntp">
      <interfaces>
        <interface>
          <manycast-client>
            </manycast-client>
          </interface>
        </interfaces>
      </ntp>
    </filter>
  </get>

<data xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <ntp xmlns="urn:ietf:params:xml:ns:yang:ietf-ntp">
    <interfaces>
      <interface>
        <name>Ethernet3/0/0</name>
        <manycast-client>
          <address>224.0.1.1</address>
          <authentication>
            <symmetric-key>
              <key-id>10</key-id>
            </symmetric-key>
          </authentication>
          <ttl>8</ttl>
          <minclock>3</minclock>
          <maxclock>10</maxclock>
          <beacon>6</beacon>
          <minpoll>6</minpoll>
          <maxpoll>10</maxpoll>
          <port>1025</port>
        </manycast-client>
      </interface>
    </interfaces>
  </ntp>
</data>
```

This example describes how to configure a manycast-server with an address of "224.0.1.1":

```
<edit-config xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <target>
    <running/>
  </target>
  <config>
    <ntp xmlns="urn:ietf:params:xml:ns:yang:ietf-ntp">
      <interfaces>
        <interface>
          <name>Ethernet3/0/0</name>
          <multicast-server>
            <address>224.0.1.1</address>
          </multicast-server>
        </interface>
      </interfaces>
    </ntp>
  </config>
</edit-config>
```

This example describes how to get multicast-server-related configuration:

```
<get>
  <filter type="subtree">
    <ntp xmlns="urn:ietf:params:xml:ns:yang:ietf-ntp">
      <interfaces>
        <interface>
          <multicast-server>
            </multicast-server>
          </interface>
        </interfaces>
      </ntp>
    </filter>
  </get>

<data xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <ntp xmlns="urn:ietf:params:xml:ns:yang:ietf-ntp">
    <interfaces>
      <interface>
        <name>Ethernet3/0/0</name>
        <multicast-server>
          <address>224.0.1.1</address>
        </multicast-server>
      </interface>
    </interfaces>
  </ntp>
</data>
```

9.7. Clock State

This example describes how to get clock current state:

```

<get>
  <filter type="subtree">
    <ntp xmlns="urn:ietf:params:xml:ns:yang:ietf-ntp">
      <clock-state>
      </clock-state>
    </ntp>
  </filter>
</get>

<data xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <ntp xmlns="urn:ietf:params:xml:ns:yang:ietf-ntp">
    <clock-state>
      <system-status>
        <clock-state>synchronized</clock-state>
        <clock-stratum>7</clock-stratum>
        <clock-refid>192.0.2.1</clock-refid>
        <associations-address>192.0.2.1\
        </associations-address>
        <associations-local-mode>client\
        </associations-local-mode>
        <associations-isconfigured>yes\
        </associations-isconfigured>
        <nominal-freq>100.0</nominal-freq>
        <actual-freq>100.0</actual-freq>
        <clock-precision>18</clock-precision>
        <clock-offset>0.025</clock-offset>
        <root-delay>0.5</root-delay>
        <root-dispersion>0.8</root-dispersion>
        <reference-time>10-10-2017 07:33:55.258 Z+05:30\
        </reference-time>
        <sync-state>clock-synchronized</sync-state>
      </system-status>
    </clock-state>
  </ntp>
</data>

```

9.8. Get All Association

This example describes how to get all associations present in the system:

```

<get>
  <filter type="subtree">
    <ntp xmlns="urn:ietf:params:xml:ns:yang:ietf-ntp">
      <associations>
      </associations>
    </ntp>
  </filter>
</get>

<data xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <ntp xmlns="urn:ietf:params:xml:ns:yang:ietf-ntp">
    <associations>
      <association>
        <address>192.0.2.1</address>
        <stratum>9</stratum>
      </association>
    </associations>
  </ntp>
</data>

```

```
<refid>203.0.113.1</refid>
<local-mode>client</local-mode>
<isconfigured>true</isconfigured>
<authentication-key>10</authentication-key>
<prefer>true</prefer>
<peer-interface>Ethernet3/0/0</peer-interface>
<minpoll>6</minpoll>
<maxpoll>10</maxpoll>
<port>1025</port>
<version>4</version>
<reach>255</reach>
<unreach>0</unreach>
<poll>128</poll>
<now>10</now>
<offset>0.025</offset>
<delay>0.5</delay>
<dispersion>0.6</dispersion>
<originate-time>10-10-2017 07:33:55.253 Z+05:30\
</originate-time>
<receive-time>10-10-2017 07:33:55.258 Z+05:30\
</receive-time>
<transmit-time>10-10-2017 07:33:55.300 Z+05:30\
</transmit-time>
<input-time>10-10-2017 07:33:55.305 Z+05:30\
</input-time>
<ntp-statistics>
  <packet-sent>20</packet-sent>
  <packet-sent-fail>0</packet-sent-fail>
  <packet-received>20</packet-received>
  <packet-dropped>0</packet-dropped>
</ntp-statistics>
</association>
</associations>
</ntp>
</data>
```

9.9. Global Statistic

This example describes how to get global statistics:

```
<get>
  <filter type="subtree">
    <ntp xmlns="urn:ietf:params:xml:ns:yang:ietf-ntp">
      <ntp-statistics>
      </ntp-statistics>
    </ntp>
  </filter>
</get>

<data xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <ntp xmlns="urn:ietf:params:xml:ns:yang:ietf-ntp">
    <ntp-statistics>
      <packet-sent>30</packet-sent>
      <packet-sent-fail>5</packet-sent-fail>
      <packet-received>20</packet-received>
      <packet-dropped>2</packet-dropped>
    </ntp-statistics>
  </ntp>
</data>
```

10. IANA Considerations

10.1. IETF XML Registry

This document registers a URI in the "IETF XML Registry" [RFC3688]. Following the format in RFC 3688, the following registration has been made.

URI: urn:ietf:params:xml:ns:yang:ietf-ntp

Registrant Contact: The IESG.

XML: N/A; the requested URI is an XML namespace.

10.2. YANG Module Names

This document registers a YANG module in the "YANG Module Names" registry [RFC6020].

Name: ietf-ntp

Namespace: urn:ietf:params:xml:ns:yang:ietf-ntp

Prefix: ntp

Reference: RFC 9249

11. Security Considerations

The YANG module specified in this document defines a schema for data that is designed to be accessed via network management protocols such as NETCONF [RFC6241] or RESTCONF [RFC8040]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [RFC6242]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [RFC8446].

The Network Configuration Access Control Model (NACM) [RFC8341] provides the means to restrict access for particular NETCONF or RESTCONF users to a preconfigured subset of all available NETCONF or RESTCONF protocol operations and content. The 'nacm:default-deny-all' is used to prevent retrieval of the key information.

There are a number of data nodes defined in this YANG module that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations. These are the subtrees and data nodes and their sensitivity/vulnerability:

`/ntp/port`: This data node specifies the port number to be used to send NTP packets. Unexpected changes could lead to disruption and/or network misbehavior.

`/ntp/authentication` and `/ntp/access-rules`: The entries in the list include the authentication and access control configurations. Care should be taken while setting these parameters.

`/ntp/unicast-configuration`: The entries in the list include all unicast configurations (server or peer mode) and indirectly creates or modifies the NTP associations. Unexpected changes could lead to disruption and/or network misbehavior.

`/ntp/interfaces/interface`: The entries in the list include all per-interface configurations related to broadcast, multicast, and anycast mode, and indirectly creates or modifies the NTP associations. Unexpected changes could lead to disruption and/or network misbehavior. It could also lead to synchronization over an untrusted source over trusted ones.

Some of the readable data nodes in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via get, get-config, or notification) to these data nodes. These are the subtrees and data nodes and their sensitivity/vulnerability:

`/ntp/authentication/authentication-keys`: The entries in the list include all the NTP authentication keys. Unauthorized access to the keys can be easily exploited to permit unauthorized access to the NTP service. This information is sensitive; thus, unauthorized access to this needs to be curtailed.

`/ntp/associations/association/`: The entries in the list include all active NTP associations of all modes. Exposure of these nodes could reveal network topology or trust relationships. Unauthorized access to this also needs to be curtailed.

`/ntp/authentication` and `/ntp/access-rules`: The entries in the list include the authentication and access control configurations. Exposure of these nodes could reveal network topology or trust relationships.

Some of the RPC operations in this YANG module may be considered sensitive or vulnerable in some network environments. It is thus important to control access to these operations. These are the operations and their sensitivity/vulnerability:

`statistics-reset`: The RPC is used to reset statistics. Unauthorized reset could impact monitoring.

The leaf `/ntp/authentication/authentication-keys/algorithm` can be set to cryptographic algorithms that are no longer considered to be secure. As per [RFC8573], AES-CMAC is the recommended algorithm.
